Team ID	6ab63709856a6a91bc38dc02	Project Name	Import Data using Transform Maps (S

Problem-Solution Fit Analysis

S.No	Problem Identified	Proposed Solution	How It Solves	Validation Approach
1	Manual data entry is slow & error-prone	Import data via Import Sets from Excel	Eliminates row-by-row manual typing	Compare source Excel rows with target table records
2	Duplicate records created on import	Configure deduplicate on unique field (e.g., Employee ID)	Prevents existing records from being imported	Review import logs and verify no duplicates
3	No visibility into imported data	Reports and dashboard on Employee Test	Provides visual summary of imported data	Verify reports display correct counts and details
4	Fields misaligned during import	Configure explicit field mapping	Source columns are mapped to exact target fields	Spot-check imported records match source data attributes
5	Data values need normalization	Transform Map data transformation	Transforms values during mapping	Review transformed records in target table

Overall Fit Assessment

The solution directly addresses each identified problem through ServiceNow's native Import Set and Transform Map capabilities. The import pipeline eliminates manual data entry, explicit field mapping ensures accurate column-to-field alignment, deduplicate prevents duplicates, and reports configured on Employee Test (u_employee_test) provide clear visual insights.
